It has been accepted for inclusion in Student Brochures by an authorized administrator of The Aquila Digital Community. For more information, please contact aquilastaff@usm.edu.
What Is Asthma?

Asthma is a disease that affects your airways. Your airways are tubes that carry air in and out of your lungs. If you have asthma, the inside of your throat becomes sore and swollen. That makes it very sensitive. When your airways are swollen, your lungs get less air.

Quiz

1. True or false: I cough frequently during the middle of the night, after exercise, and when I am around cats, but I have never wheezed. This means that I do not have asthma.

2. True or false: Asthma has different causes in different people. Allergies such as dust mites or molds, often contribute to asthma symptoms.

3. True or false: My child was recently diagnosed with asthma. She will not be able to do the things that other kids can do, and she may not be able to have an active childhood.

Answers are listed below

References

1. False 2. True 3. False
Different Types of Asthma

Exercised-induced Asthma - a closing of the airways in the lungs that is caused by exercise. It causes trouble breathing, wheezing, coughing and other symptoms during or after exercise.

Night Time Asthma - worsening of asthma at night. Symptoms include long lasting sinus problems, reflux and sleep apnea.

Work Asthma - things in the work place that cause the airways of the lungs to get smaller or enlarge.

Drug-induced Asthma - redness and swelling that comes from taking a specific drug.
